**Prevenzione e gestione
delle co-morbidity associate all'infezione da HIV**

Both osteopenia and osteoporosis are very common in HIV population

8° WORKSHOP NAZIONALE CISAI

PERUGIA, 30 - 31 MARZO 2017

Prevenzione e gestione
delle co-morbidity associate all'infezione da HIV

HIV by itself is associated with osteopenia and osteoporosis

	N=269 *
Age, median (IQR)	38 (31,44)
Male (%)	85%
White non-Hispanic Race (%)	47%
HIV RNA log ₁₀ c/mL, median (IQR)	4.62 (4.24,4.90)
HIV RNA ≥ 100,000 c/mL (%)	41%
CD4 cells/mm ³ , median (IQR)	233 (106,334)
CD4 < 200 cells/mm ³ (%)	43%
Lumbar spine T score ≤ -1 (%)	35%
BMI, Median (IQR)	24.9 (21.8, 28.2)
Limb fat kg, Median (IQR)	7.4 (4.7,10.1)

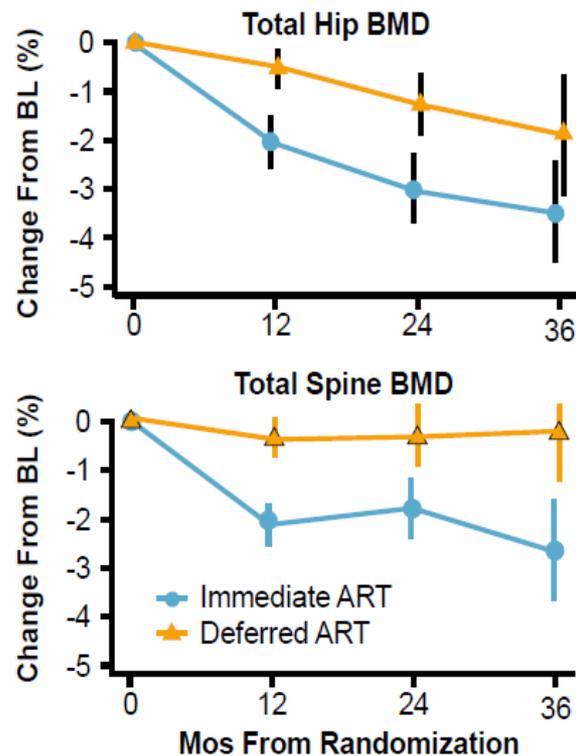

Baseline prevalence of osteopenia/osteoporosis 35%

When we start ARV therapy patients lose bone

Independently of the regimen

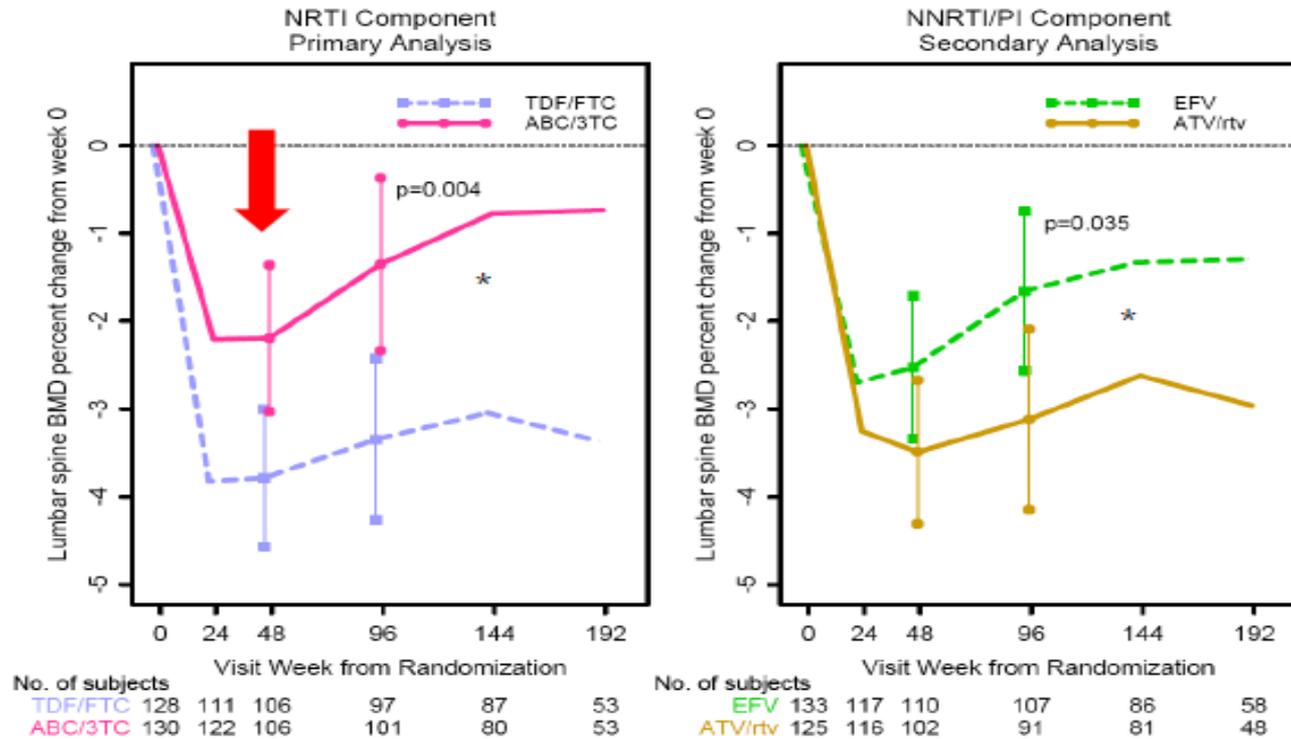

START Substudy

- Substudy included 193 pts in early ART arm and 204 pts in deferred ART arm with f/u
- Greater BMD loss in hip and spine with immediate vs deferred ART
 - Estimated mean difference for hip: -1.5% (95% CI: -2.3% to -0.8%; $P < .001$)
 - Estimated mean difference for spine: -1.6% (95% CI: -2.2% to -1.0%; $P < .001$)
- Osteoporosis incidence similar between arms ($P = .27$)
- PI treatment in first regimen associated with spine BMD decrease

When we start ARV therapy patients lose bone

Some drugs more than others

* -linear regression
 No significant interaction of NRTI and NNRTI/PI components (p=0.63)

PERUGIA, 30 - 31 MARZO 2017

Prevenzione e gestione delle co-morbidity associate all'infezione da HIV

Some people lose more bone than others

Patients with higher VL and with more improvement in CD4 lose more bone

Figure 3: Baseline HIV-1 RNA vs. Week 96 BMD change (— = LOWESS curve)

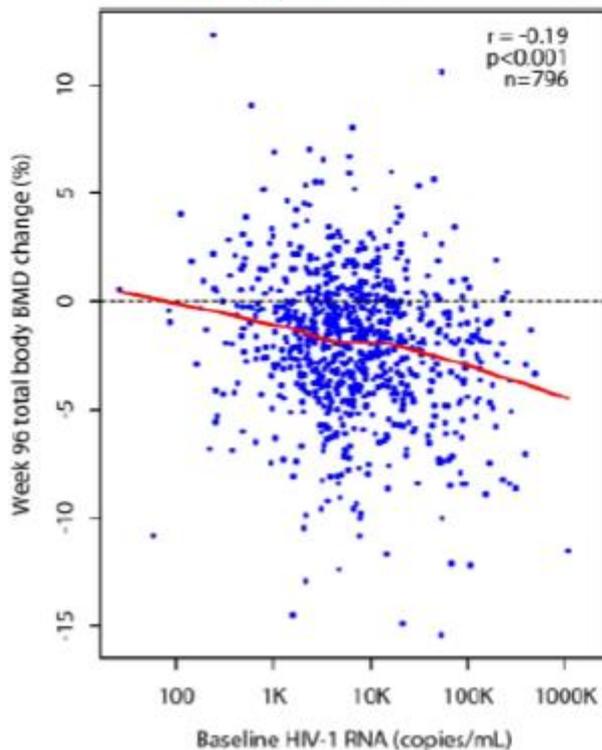

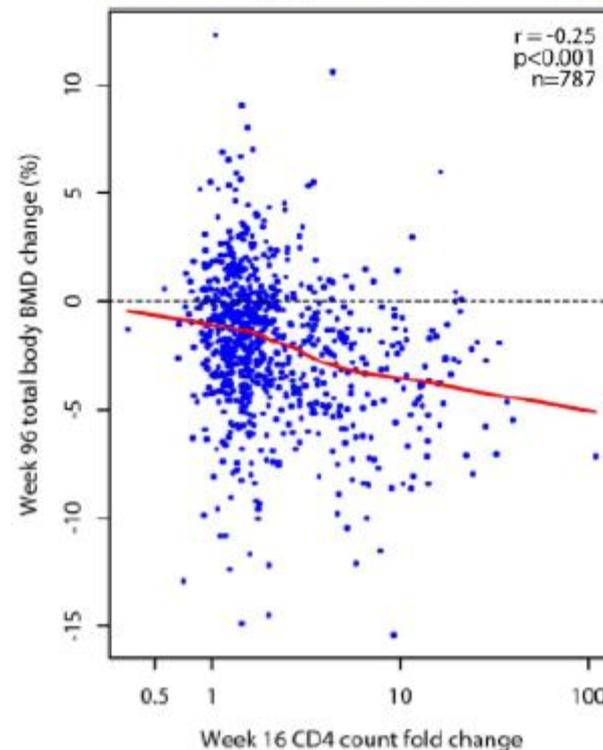

Figure 4: Week 16 CD4 fold change vs. Week 96 BMD change (— = LOWESS curve)

8° WORKSHOP NAZIONALE CISAI

PERUGIA, 30 - 31 MARZO 2017

Prevenzione e gestione
delle co-morbidità associate all'infezione da HIV

Some people lose more bone than others

Table 1. Patients characteristics clustered according to the development or not of bone diseases.

Parameters	No bone diseases (n = 48)	Osteopenia or osteoporosis (n = 150)	P value
TDF therapy (days)	1683 ± 1417	2209 ± 1109	<0.01
TDF concentrations (ng/ml)	142 ± 136	157 ± 139	0.51
Female sex (%)	47.9%	43.3%	0.33
Age (years)	46 ± 10	51 ± 8	<0.01
Concomitant ARV drugs (%)	50% protease inhibitor 33% NNRTI 17% other	55% protease inhibitor 35% NNRTI 10% other	0.74
BMI (kg/m ²)	23.8 ± 4.6	22.2 ± 3.9	<0.05
Serum creatinine before TDF (mg/dl)	0.80 ± 0.19	0.78 ± 0.19	0.65
Serum creatinine last f.u. (mg/dl)	1.0 ± 0.3	0.9 ± 0.3	0.16
CD4 (cells/μl)	585 ± 252	654 ± 286	0.15
HBV or HCV coinfection (%)	38%	43%	0.51

Significantly higher TDF concentrations were found in patients with altered vs normal osteocalcin levels (TDF concentrations: 288±173 vs. 153±115 ng/ml, P<0.01)

Involvement of TDF only in the process of bone formation

8° **WORKSHOP NAZIONALE CISAI**

PERUGIA, 30 - 31 MARZO 2017

**Prevenzione e gestione
delle co-morbidity associate all'infezione da HIV**

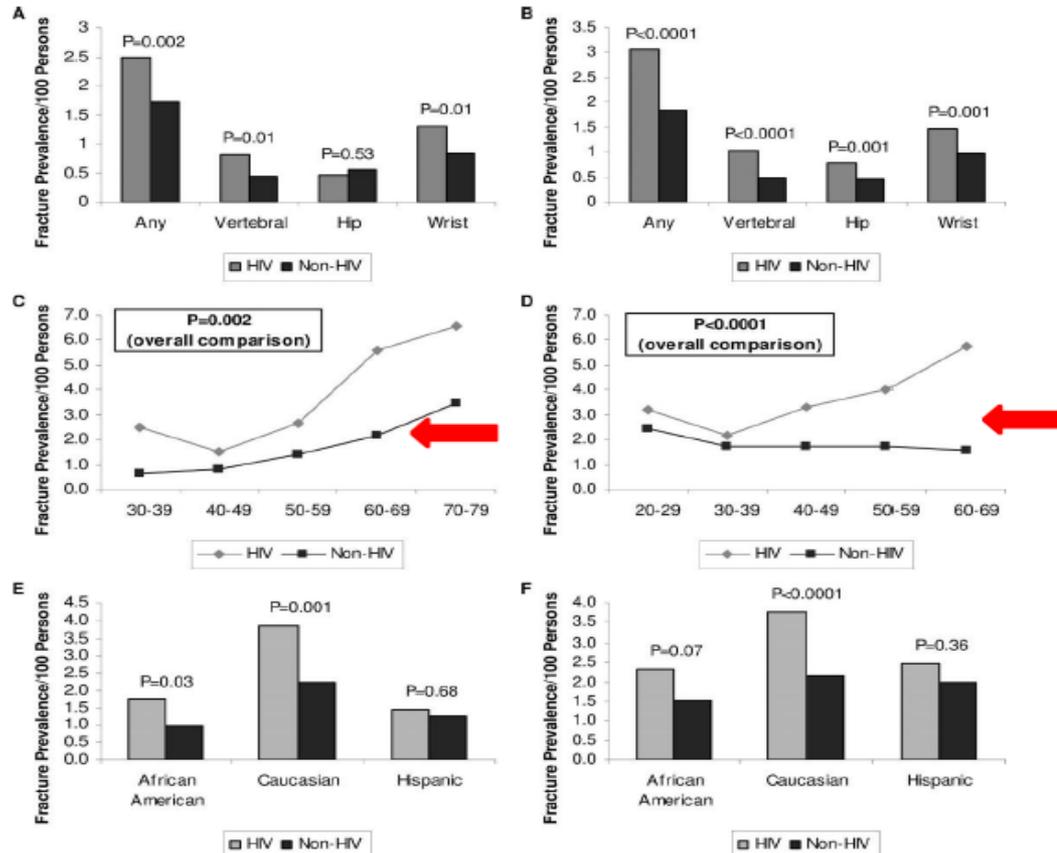

Risk factors for osteoporosis or fracture

- Advanced age; female sex
- Estrogen deficiency
- Hx fracture as adult
- Hx fragility fracture in 1° relative
- Current cigarette smoking
- Alcoholism
- Low body weight (<127 lbs)
- White race or Asian race
- Low calcium intake
- Low physical activity
- Poor health/frailty; falls
- Poor eyesight (despite correction)
- Dementia; cognitive impairment
- Impaired neuromuscular fxn
- Residence in nursing home
- Hx glucocorticoids >3 mos
- Long-term heparin therapy
- Anticonvulsant therapy
- Aromatase-inhibitor therapy
- Androgen-deprivation therapy

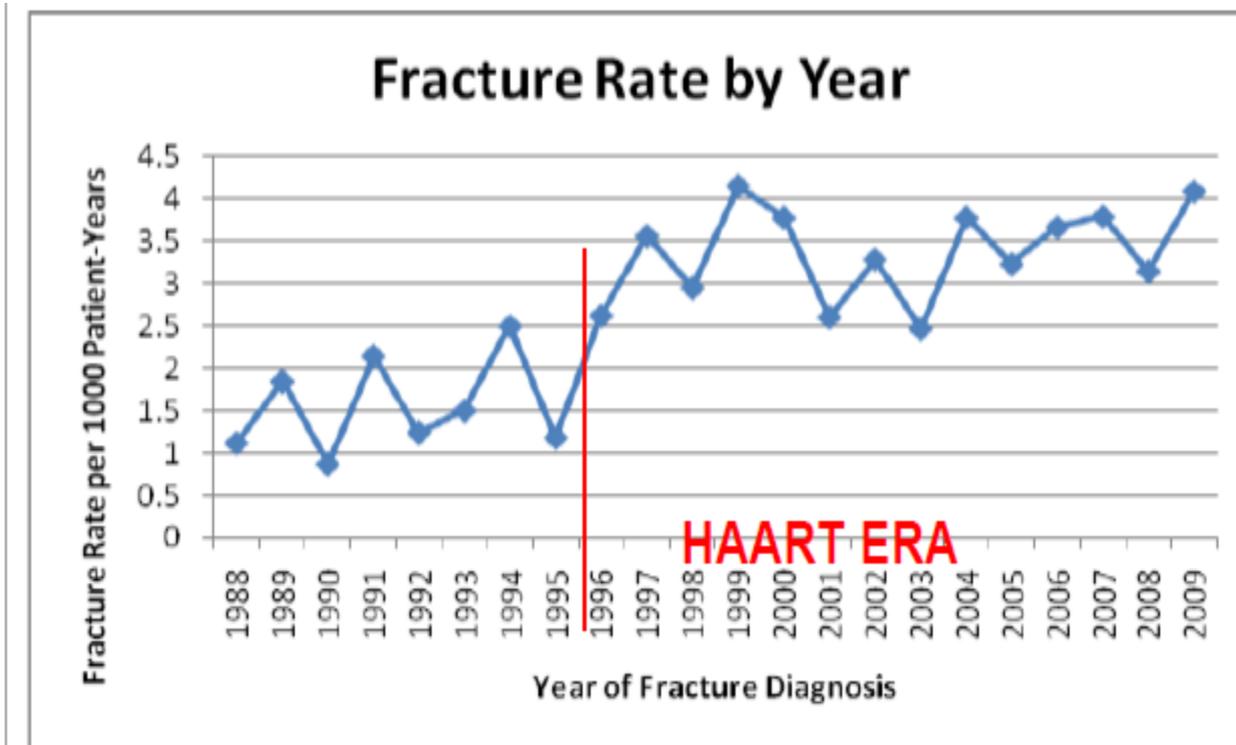

This problem is clinically relevant

Patients with HIV have more fractures than non HIV

The rate of fractures has increased in the HAART era

The pathogenic mechanism is probably immune reconstitution (plus bone toxicity of tenofovir)

ARTICLE

Received 18 Oct 2014 | Accepted 4 Aug 2015 | Published 22 Sep 2015

doi:10.1038/nrn3283

Role of T-cell reconstitution in HIV-1 antiretroviral therapy-induced bone loss

Ighovwerha Oforokun^{1,2*}, Kehmia Titani^{3,4*}, Tatyana Vikulina^{3,4*}, Susanne Roser-Page^{4,5*}, Masayoshi Yamaguchi², Majd Zayzafoon⁵, Ilor R. Williams⁶ & M. Neale Weitzmann^{3,4*}

What they did:

- transplant T cells into immunocompromised mice to mimic ART-induced T-cell expansion

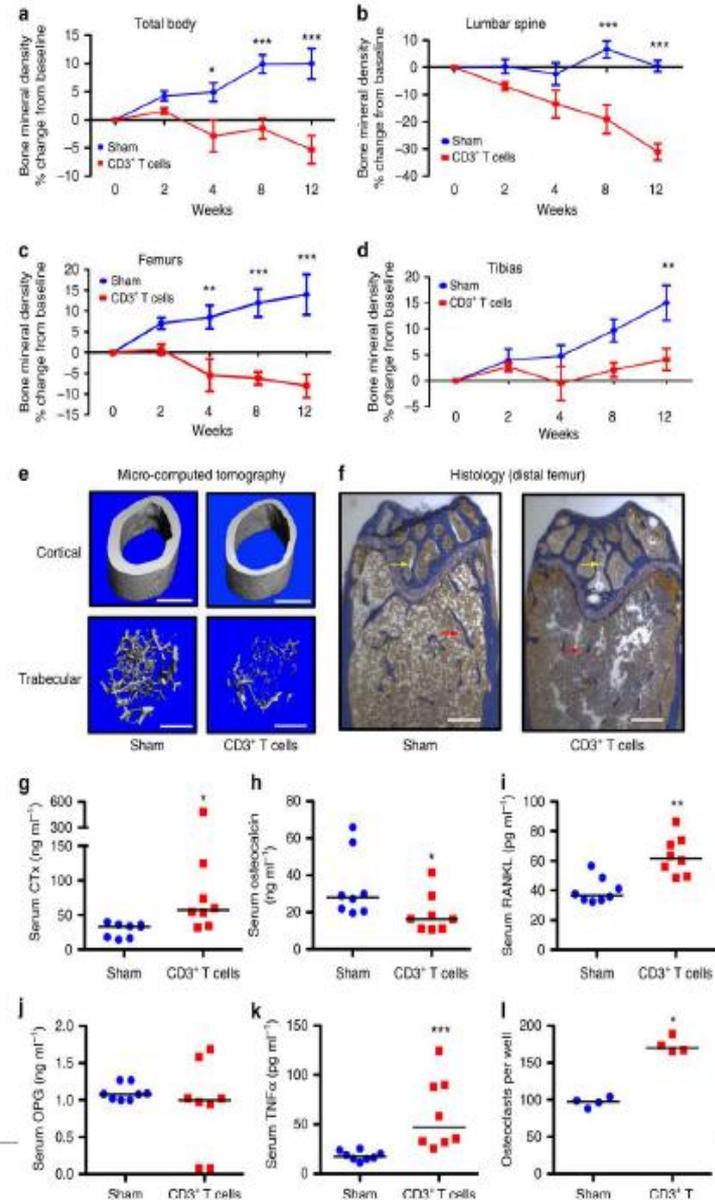

What they saw:

- Bone loss associated with the reconstitution

ADS, 2016 Jan 28;30(3):405-14. doi:10.1097/QAD.0000000000000918.

Antiretroviral therapy induces a rapid increase in bone resorption that is positively associated with the magnitude of immune reconstitution in HIV infection.

Oforokun¹, Titani², Vunnava A, Roser-Page S, Vikulina T, Villinger F, Rogers K, Sheth AN, Lahiri CD, Lennox JL, Weitzmann MN.

PERUGIA, 30 - 31 MARZO 2017

Prevenzione e gestione
delle co-morbidità associate all'infezione da HIV

TAF is more bone friendly than TDF (switch in low BMD)

(GS-112-109 pooled analysis)

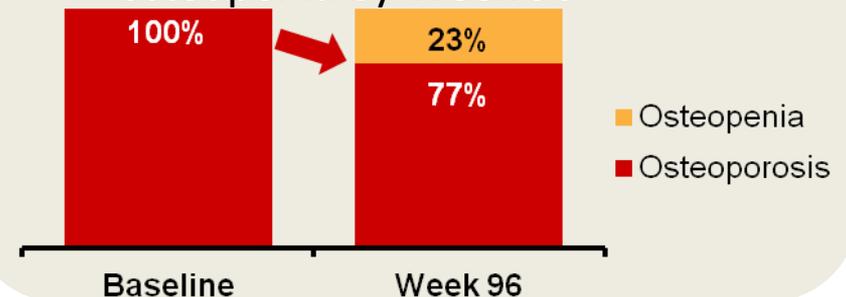

Analysis of outcomes and predictors of clinically significant BMD increases ($\geq 5\%$) at W96 in the 214 subjects with low baseline BMD (T-score ≤ -2.0) in pooled TAF studies (E/C/F/TAF Studies 109 and 112)

Baseline T-score ≤ -2.0

- Significant BMD increases observed
 - Spine: +2.53% ($p < 0.001$)
 - Hip: +2.39% ($p < 0.001$)
- Proportion of low BMD participants experiencing $\geq 5\%$ BMD increase
 - Spine: 27% (52/193)
 - Hip: 16% (32/195)

Baseline T-score ≤ -2.5

- 86 subjects with low baseline BMD also had osteoporosis*
 - 23% of these subjects improved to osteopenia by Week 96

- Factors predicting $\geq 5\%$ BMD increase after a switch from TDF to TAF:
 - Urinary phosphate wasting ($\text{FEPO}_4 \geq 10\%$) or
 - High bone turnover (P1NP levels $> 1.72 \log_{10}$ ng/mL)

- Using cost-effectiveness methods, we find that current conditions warrant an annual premium of up to \$1000 over the average wholesale price (AWP) of TDF.
- Once generic coformulations of tenofovir/lamivudine become accessible, however, the appropriate premium for TAF will likely merit a downward adjustment

Recommendations for Evaluation and Management of Bone Disease in HIV

Todd T. Brown,¹ Jennifer Hoy,² Marco Borderi,³ Giovanni Guaraldi,⁴ Boris Renjifo,⁵ Fabio Vescini,⁶ Michael T. Yin,⁷ and William G. Powderly⁸

¹Division of Endocrinology, Diabetes and Metabolism, Johns Hopkins University School of Medicine, Baltimore, Maryland; ²Department of Infectious Diseases, Alfred Hospital and Monash University, Melbourne, Australia; ³Infectious Diseases Unit, Department of Medical and Surgical Sciences, Alma Mater Studiorum University of Bologna, and ⁴Department of Medical and Surgical Sciences for Children and Adults, University of Modena and Reggio Emilia, Modena, Italy; ⁵Global Medical Affairs Virology, Global Pharmaceutical Research and Development, AbbVie, North Chicago, Illinois; ⁶Endocrinology and Metabolism Unit, University Hospital "Santa Maria della Misericordia," Udine, Italy; ⁷Department of Medicine, Columbia University Medical Center, New York, New York; and ⁸Division of Infectious Diseases, Washington University School of Medicine, St Louis, Missouri

Thirty-four human immunodeficiency virus (HIV) specialists from 16 countries contributed to this project, whose primary aim was to provide guidance on the screening, diagnosis, and monitoring of bone disease in HIV-infected patients. Four clinically important questions in bone disease management were identified, and recommendations, based on literature review and expert opinion, were agreed upon. Risk of fragility fracture should be assessed primarily using the Fracture Risk Assessment Tool (FRAX), without dual-energy X-ray absorptiometry (DXA), in all HIV-infected men aged 40–49 years and HIV-infected premenopausal women aged ≥ 40 years. DXA should be performed in men aged ≥ 50 years, postmenopausal women, patients with a history of fragility fracture, patients receiving chronic glucocorticoid treatment, and patients at high risk of falls. In resource-limited settings, FRAX without bone mineral density can be substituted for DXA. Guidelines for antiretroviral therapy should be followed; adjustment should avoid tenofovir disoproxil fumarate or boosted protease inhibitors in at-risk patients. Dietary and lifestyle management strategies for high-risk patients should be employed and antiosteoporosis treatment initiated.

Keywords. bone disease; fragility fracture; human immunodeficiency virus; osteoporosis.
